

## *Hunting for Fossils*

When **scientists** find a **dinosaur fossil** they have to work very hard to get it out of the **rock** it is encased in. They use **trowels** and **hammers** to carefully dig away the **rock**. Then they use **brushes** to dust the **fossil** and **water** to clean it up.

The largest complete **Tyrannosaurus fossil** in the world is known as **Sue**. It was named after **Sue Hendrickson**, the palaeontologist from **America** who discovered it.
