

The Gigantosaurus

Gigantosaurus lived about 112 – 90 million years ago in what is nowadays the country of Argentina. It was 12.5 metres high (which was even taller than Tyrannosaurus Rex) and it weighed about 8,000 kilograms. It was a meat-eating dinosaur (a carnivore) and it used long sharp teeth to devour its prey. A T Rex had two fingers on its front legs but Gigantosaurus had three. Scientists think that the dinosaur's skin may have been stripy so that it could be camouflaged in forests.
